

BA PREP AI

From interview preparation tool to data-informed product

1. Problem & Opportunity

Business Analysts preparing for interviews often rely on fragmented resources for resume evaluation, interview practice, and BA requirement exercises. The opportunity was to bring these workflows into one AI-assisted experience focused on **role-specific preparation and actionable feedback**.

2. Target User

Business Analyst in active job search

- 2–4 years' experience
- Preparing for BA/Product interviews
- Needs role-specific rather than generic preparation
- Wants actionable feedback on gaps and readiness

3. Product & User Journey

An AI-powered platform combining:

- **Recruiter Assistant** — interview and experience-based Q&A
- **Job Fit Intelligence** — assess alignment with a role
- **Mock Interview** — practice interview scenarios
- **BA Toolkit** — generate user stories, acceptance criteria and requirement documentation

Journey:

Understand role → Assess fit → Prepare → Practice → Identify gaps → Improve

4. MVP & Prioritization

The MVP focused on four complementary workflows covering the core preparation journey rather than building a large number of disconnected features.

Prioritization was based on:

- Direct relevance to interview preparation
- Reusability across BA/Product roles
- Ability to generate actionable user feedback
- Feasibility within the initial product scope

5. Analytics Approach

Defined an event-based analytics model and analyzed product usage using **SQL + Power BI**.

Key metrics

- **118** users
- **110** conversations
- **130** sessions
- **9.32%** returning users

- **16%** 7-day retention

6. What the Data Showed

- **Recruiter Assistant** was the dominant feature.
- **Job Fit Intelligence** showed meaningful adoption but lower completion.
- **Mock Interview** had the largest completion gap at **20%**.
- **Behavioral** and **Business Analysis** were the strongest interview-topic categories.

7. Product Decisions

Rather than immediately adding more features, prioritize improving the **Mock Interview experience** and investigate the causes of abandonment.

Initial hypotheses:

- Workflow friction
- Limited progress/feedback visibility
- Interview length
- Unclear completion value

These are **hypotheses to validate**, not conclusions from the dataset.

8. Roadmap

V1 — Foundation

BA PREP AI + Job Fit + Mock Interview + BA Toolkit

V2 — Engagement

Improve Mock Interview completion + personalized practice

V3 — Personalization

JD-driven skill-gap analysis → personalized preparation → progress tracking

9. Success Metrics

7-day retention · Feature adoption · Workflow completion · Repeat sessions · Interview preparation engagement

Analytics figures are based on a simulated product-event dataset created for portfolio analysis.
